

PACER Method Review

Tuesday, August 19, 2025 17:59

1. Procedural:

This category covers "how-to" information, like a recipe or a medical procedure. The targeted process is practice; applying the steps immediately after learning helps with retention.

2. Analogous:

This involves relating new information to prior knowledge through comparisons. The recommended process is critique, where you analyze the similarities and differences between the new concept and your existing knowledge.

3. Conceptual:

This refers to abstract principles, theories, or facts. Mapping, using techniques like mind maps, is helpful for visualizing the relationships between concepts.

4. Evidence:

This includes facts, statistics, and case studies that support conceptual knowledge. Store and Rehearse is the key here, involving methods like taking notes and using flashcards to reinforce the information.

5. Reference:

This category includes specific details that are important for quick recall, like dates or definitions. Flashcards and spaced repetition are effective for storing and retrieving this type of information.
